

WKM Pow-R-Seal Gate Valves

High-quality, through-conduit, expanding gate valves engineered for performance in critical isolation applications where a tight mechanical seal that is normally unaffected by pressure variations and vibrations is needed.

WKM Pow-R-Seal Gate Valves

Ville Platte, La.,
USA

Cameron is a leading provider of valves and measurement systems to the oil and gas industry. Our products are primarily used to control, direct, and measure the flow of oil and gas as it is moved from individual wellheads through flowlines, gathering lines, and transmission systems to refineries, petrochemical plants, and industrial centers for processing.

Cameron provides a wide range of valves for use in natural gas, LNG, crude oil, and refined products transmissions lines. The traditional CAMERON® fully welded ball valve product line has been combined with the GROVE®, RING-O®, TOM WHEATLEY®, ENTECH™, and TK® product lines. This broad offering has strengthened Cameron's ability to serve as a single source for a wide scope of customer requirements. Cameron also provides critical service valves for refinery, chemical, and petrochemical processing businesses, and for associated storage terminal applications, particularly through the ORBIT® and GENERAL VALVE® lines. These brands are complemented by WKM®, TBV™, and TEXSTEAM™ valve products and considerably expand the scope of our product offerings.

Cameron's WKM Pow-R-Seal™ gate valve's smooth continuous bore reduces turbulence. Additionally, the seat faces are outside the flow stream and are protected from contact with the lading whether the valve is in the open or closed position. The WKM Pow-R-Seal gate valve's full bore makes it possible to run pigs, scrapers, or hot tap cutters through the valves without danger of damaging the valve, lodging the scraper, or jamming it with metal cuttings.

DESIGN

Cameron's WKM Pow-R-Seal valve's design provides the following specific advantages for reliable performance and long life, even in fluid, gas, steam, and hot water critical services up to 1000° F (538° C).

Protection of Seat Faces

Seat faces are outside the flow stream and in full contact with the gate, in both fully open and fully closed positions, greatly extending the seat life.

Smooth, Continuous Conduit for Flow

Destructive turbulence is nearly eliminated. In a full-bore valve, pressure drop through the valve is no greater than that through an equal length of equal diameter pipe.

Tight Mechanical Seal and Double Block-and-Bleed Capability

The WKM Pow-R-Seal valve's parallel expanding gate design provides a tight mechanical seal, upstream and downstream simultaneously, which is normally unaffected by pressure variations or vibration.

Metal-to-Metal Mechanical Sealing

The seal is unaffected by pressure surges, vibration, or heat under normal operating conditions. First, the seat insert contacts the gate. Then, the insert is compressed and a metal-to-metal seal is established.

Commonly Used Applications

- Pumps station isolation
- Launchers and receivers
- Decoking systems
- Gathering lines

FEATURES

1. Through-Conduit Parallel Expanding Gate Valve

- Provides a tight mechanical seal
- Full-bore design reduces pressure drop and allows passage of all types of scrapers (pigs)
- Nickel-plated gate and segment standard

2. Fugitive Emissions-Tested SLS Stem Seal*

- Stem seal is completely contained in the bonnet
- Stem is centralized by bearings
- Nickel-plated stem standard
- Seal is self-adjusting and does not depend on plastic packing
- PTFE compound resists virtually all ladings
- Pedestal supports the seal and acts as a stem scraper
- 6" to 24" (150 mm to 600 mm) Class 300 to 900 valves are fire-tested to API 6FA 3rd Edition

3. Interference Fit Seats

- Double sealing and in-line replaceable
- Upstream and downstream sealing
- Block-and-bleed per API 6D standards
- Simple design is resistant to dirty service
- Insert initiates the seal and helps clean the gate**
- Seats are compatible with virtually all ladings
- Seats may be lubricated to promote long life, reduce operating torques or effect a seal in an emergency
- Fire-tested to API 6FA 3rd Edition

4. Bolted Bonnet Valve is In-Line Repairable

- Bonnet seal resists virtually all landings
- Design provides metal-to-metal, tight sealing ideal for high temperature applications

5. Yoke-Tube Upper Flanges Comply with MSS-SP102 Standards

- Simplifies operator mounting
- Can also be manufactured to comply with ISO 5240

6. Single-Piece Cast Body Center Section

- Provides the necessary strength to resist pipeline bending
- Smooth shape reduces stress concentrations
- Made from pressure vessel quality steel

7. Valve Stroke is Established by Manufacturing Tolerances

- Stays in adjustment

8. LeverLock® Gate Centralizer***

- Retains gate and segment assembly in a neutral position during opening and closing travel
- Permits expansion of the assembly at the proper moment for seating

* For Model E-1C; does not apply to high-temperature valves. In-house FE testing only.

** High-temperature valves do not have insert

*** Standard on 6" and larger valves

OPTIONS

Bonnet Seal

- 6" to 12" (150 mm to 300 mm): flat metal gasket
- 14" to 24" (350 mm to 600 mm): O-ring seal
- High-temperature valves: spiral-wound metal gasket with a non-asbestos filler

Options

- Lubrication, packing, drain extensions
- Stem and yoke tube extensions
- Variety of coatings (coal tar epoxy for buried service, two- to three-part coating systems for marine environment, inorganic zinc rich epoxy, etc.)
- HF-6 overlay is available on request for the gate segment assembly and seat sealing surfaces
- Handwheel operator* (position indicator standard)
- Bevel gear operator (position indicator standard)
- Less gearing (bare stem)
- Electric motor operator
- Several types of body cavity thermal relief systems available
- Variety of paint and coatings

* 6" through 10" (150 mm through 250 mm) Class 300 to 900 valves and 12" (300 mm) Class 300 to 600 valves only are available in selected sizes.

OPERATION

60 years of worldwide service in oil, gas, chemicals, water, slurry, and multiproduct applications has established the WKM Pow-R-Seal valve as one of the most trusted gate valves, where safety and seal reliability are critical.

The parallel expanding gate design provides a tight mechanical seal which is normally unaffected by vibrations or pressure variations.

The rigid, cast steel body resists pipeline bending

moments which could affect seat sealing in other valves.

PTFE seals on both faces of the valve provide drop tight sealing, while metal-to-metal contact between the seals and gate mechanism provides tight shutoff.

All-metal seals also are available for service to 1000° F (538° C), where leakage rates comply with API 6D and ISO 5208 standards.

Sealed Closed

In the fully closed position, the segment has engaged with an end stop and the gate is wedged downward, expanding the segment and gate so that they form a tight mechanical closure against the upstream and downstream seats. Venting the body cavity will provide total, tight shutoff.

Mid-Travel

During travel towards opening, the gate slides across the wedge angle of the segment, collapsing the assembly so that it travels freely between the seal faces. The patented LeverLock gate centralizer holds the mechanism in the neutral position until seal expansion is required.

Fully Open

When the bore in the segment is aligned with the conduit bore, an end stop prevents further travel and the gate slides across the wedge angle, expanding the gate and the segment, isolating the flow from the body. The preferred flow direction ensures easier operation.

LeverLock Mechanism

The lever arm is held parallel to the gate faces by the skirt plates while the assembly is moving through its stroke. Near end-of-travel, the skirt allows the lever to tilt. The gate and segment slide against their angled faces, creating the expanding seal action. In their final position, the gate and segment are mechanically secured in place. The skirt plates are guide rails at the sides of the gate. The skirts align the gate and segments with the seats.

Single Spring-Loaded (SLS) Seal

FEATURES AND BENEFITS

The SLS stem seal system is designed to provide optimum performance while requiring minimal maintenance. Our in-house lab tests have shown FE leak rates below 500 ppm.

Testing and Certifications

- Fire tests per API 6FA, BS 6755 Part 11
- ISO 10497

Design

- Single spring-loaded lip seal
- Lantern ring
- Chevron ring(s)
- Lower pedestal
- Upper adapter

Features

- Self-adjusting seal designed to reduce maintenance
- No plastic packing required to establish an effective seal
- Four separate sealing bands to promote reliability
- Filled PTFE shell backed with a corrosion-resistant alloy spring (making it suitable for virtually all line media)
- Metal spring provides an initial seal and uniform loading over a wide temperature range
- Lantern ring acts as a spacer in conjunction with the upper adapter as a bearing to center the stem
- Lower pedestal support seal acts as a stem wiper to keep contaminants away from sealing members
- Chevron ring(s) act as an emergency seal, should it be necessary to inject plastic packing, and keeps foreign matter away from the seal

Thermal Relief System

OPERATION

Because of the split gate design, it is possible for excess body pressure to develop in the body cavities of closed valves. This usually results from heating that takes place in the valves while in liquid service. A thermal body cavity relief system is provided to relieve this excess body pressure. Thermal relief systems which direct excess body pressure to the upstream conduit are standard. This system consists of two needle valves, a check valve,

tubing and two fittings. Body pressure greater than the segment conduit pressure causes the check valve to unseat and relieve excess pressure to the upstream conduit. The needle valves must be kept open while the valve is in service. These needle valves can be used to isolate the line pressure to service the relief systems, as needed.

Typical Thermal Body Cavity Relief Arrangement

Item	Part	Qty.
1	Needle Valve	2
2	Female Tubing Connector	1
3	Check Valve	1
4	Male Tubing Connector	1
5	Tubing	1
	Tag (Not Shown)	2
	Wire (Not Shown)	1

Notes: These items are on the lettered side of the valve (letters not shown in diagram above).
Special thermal relief systems are available upon request.

*14" to 24" (350 mm to 600 mm) Class 300 valves have Class 400 end-to-end dimensions.
Note: 30" and 36" (750 mm and 900 mm). Class 300 and 600 prices are available upon request.

- Note:
1. Use recommended operating thrust and torques for sizing bevel gear operators.
 2. Use block-and-bleed thrusts and torques for sizing power operators (electric, gas, hydraulic, etc.).
 3. Maximum operating thrust and torques are the maximum allowable for the valve.

OPERATOR INTERFACE

The operator interface on 6" through 12" (150 mm through 300 mm) valves is manufactured to comply with ISO 5210 and MSS-SP-102.

The operator interface on 14" (350 mm) and larger valves is manufactured to comply with MSS-SP-102.

FLOW COEFFICIENTS (C_V)

The following chart outlines the C_V for through conduit gate valves having end-to-end dimensions and bore diameters in compliance with API 6D. *

Since C_V is a calculated number, the actual value may vary.

Valve Size in. (mm)	300	400	600	900	1500	2500

TRIM CHART

Service	Trim Code	Body and Bonnet	Gate and Segment	Seat	Stem Seal	Stem	Bolting	Fittings	Temperature Range
Waterflood, Corrosive	T-10	WCC Carbon Steel, Nickel-Plated	Carbon Steel 300-600, Low Alloy 900 Nickel-Plated	Carbon Steel, Nickel-Plated PTFE Insert	PTFE	Low Alloy Steel, Nickel-Plated	Alloy Steel NACE	Stainless Steel	-20° F to 250° F (-29° C to 121° C)
Standard 2" - 4" only	T-11	WCC Carbon Steel	Carbon Steel, Low Alloy Steel, Nickel-Plated	Carbon Steel, Nickel-Plated PTFE Insert	FKM Viton	Low Alloy Steel, Nickel-Plated	Alloy Steel	Carbon Steel	-20° F to 250° F (-29° C to 121° C)
Sour, Mildly Corrosive 2" and larger	T-24	WCC Carbon Steel	Carbon Steel 300-600, Low Alloy 900 Nickel-Plated	Carbon Steel, Nickel-Plated PTFE Insert	PTFE	Low Alloy Steel, Nickel-Plated	Alloy Steel NACE	Stainless Steel	-20° F to 250° F (-29° C to 121° C)
High-Temperature	T-30	WCC Carbon Steel	CA6NM Stainless Steel, HF-6 Hard Faced	Carbon Steel, HF-6 Hard Faced	Flexible Graphite	400 Series Stainless Steel	Alloy Steel	Stainless Steel	-20° F to 650° F (-29° C to 343° C)
High-Temperature	T-31	WC6 Carbon Steel	CA6NM Stainless Steel, HF-6 Hard Faced	A182 F11 Carbon Steel, HF-6 Hard Faced	Flexible Graphite	400 Series Stainless Steel	Alloy Steel	Stainless Steel	-20° F to 1000° F (-29° C to 538° C)
Low-Temperature, Non-Sour	T-36	LCC Carbon Steel Impact-Tested	Nickel-Plated Carbon Steel 300-600 Low Alloy Steel 900 Class	Carbon Steel, Nickel-Plated PTFE Insert	PTFE	Low Alloy Steel, Impact Nickel-Plated	Alloy Steel, Impact-Tested	Stainless Steel	-50° F to 250° F (-46° C to 121° C)
Low-Temperature, Sour	T-37	LCC Carbon Steel Impact-Tested	Nickel-Plated Carbon Steel 300-600 Low Alloy Steel 900 Class	Carbon Steel, Nickel-Plated PTFE Insert	PTFE	Low Alloy Steel, Impact Nickel-Plated	Alloy Steel, Impact-Tested	Stainless Steel	-50° F to 250° F (-49° C to 121° C)
Standard 6" and larger	T-101	WCC Carbon Steel	Carbon Steel 300-600, Low Alloy 900 Nickel-Plated	Carbon Steel, Nickel-Plated PTFE Insert	PTFE	Low Alloy Steel, Impact Nickel-Plated	Alloy Steel	Carbon Steel	-20° F to 250° F (-29° C to 121° C)
Standard Special Services 6" and larger	T-102	WCC Carbon Steel	Carbon Steel 300-600, Low Alloy 900 Nickel-Plated	Carbon Steel, Nickel-Plated PTFE Insert	PTFE	Low Alloy Steel, Impact Nickel-Plated	Alloy Steel	Carbon Steel	-20° F to 250° F (-29° C to 121° C)

COMMON TRIMS

Waterflood (Uninhibited) (T-10) – Carbon steel body/bonnet with wetted surface, ENP-plated, internal parts of corrosion-resistant materials.

Model M (Sizes 2" to 4", (50 mm to 100 mm), Classes 600 through 1500) Standard (T-11) – For non-corrosive aromatic service with concentration of MTBE to 100%.

Sour Gas and Oil (NACE MR0175) (T-24) – Primarily for sour gas and oil (NACE MR0175) where resistance to H₂S embrittlement is required. Also suitable for other chemicals, products or hydrocarbons when H₂S is present. May be used when CO₂ is present in smaller amounts than H₂S.

High-Temperature -20° F to 650° F (-29° C to 343° C) (T-30) – For higher temperature service where the corrosion resistance and wire drawing resistance of the stainless internals with stellite overlay are suitable. The limiting temperature is a function of the body material which follows the appropriate pressure rating table. (Ref. ASME Std. B16.34, 1977).

High-Temperature Up to 1000° F (538° C) (T-31) – For service above 550° F (288° C). Same qualifications as T-30, except metal-to-metal seating is only required for temperatures from 650° F to 1000° F (343° C to 538° C).

Low-Temperature -50° F (-46° C) NACE (T-36) – For essentially non-corrosive ladings, either liquid or gaseous. The pressure-retaining components (body, bonnet and bolting) are of impact-tested materials.

Low-Temperature Sour -50° F (-46° C) NACE (T-37) – Primarily for sour gas and oil (NACE MR0175) where resistance to H₂S embrittlement is required at -50° F (-46° C) service. The pressure-retaining components (body, bonnet and bolting) are of impact-tested materials. Also suitable for other chemicals, products or hydrocarbons when H₂S is present. Can be used when CO₂ is present in smaller amounts than H₂S.

Aromatic (to 40% MTBE, Fire-Tested API 6FA or ISO 10497) (T-101) – For essentially non-corrosive, non-sour aromatic or non-aromatic service with methanol or ethanol based corrosion inhibitors where up to 40% MTBE may be present.

High-Aromatic (Special Services for 6" to 24" [150 mm to 600 mm], Classes 300 to 1500) (T-102) – For non-corrosive aromatic service with concentration of MTBE, Ethanol, Methanol to 100 percent.

PARTIAL OPEN FLOW CHARACTERISTICS

The following graph approximates the flow coefficient, C_v or K_v , of gate valves as a function of the valve stroke going from closed to open. Note that this is an estimation only because of assumptions made in the valve stroke, as well as unpredictable flow characteristics around the gate-seat bore in the partially open position.

Gate valves are intended for on-off service. Intermittent throttling such as pressure equalization service is acceptable. Continuous throttling is not recommended. This information is provided only to facilitate the engineering of systems in the transition between open and closed positions of the valves. One example might be to evaluate the possibility of water hammer in liquid pipelines.

Partial Open Flow Characteristics (Through-Conduit Gate Valves)

CAMSERV™ Aftermarket Services for Valves and Actuation

WE BUILD IT. WE BACK IT.

Global Network and Local Support

Cameron is well-positioned to deliver total aftermarket support, quickly and efficiently, with unmatched OEM expertise. Our highly skilled engineers and technicians are available around the clock, seven days a week, to respond to customer queries, troubleshoot problems, and offer reliable solutions.

Easily Accessible Parts and Spare Valves

- OEM spare valves, actuators, and parts (including non-Cameron brands)
- Handling, storage, packaging, and delivery
- Dedicated stocking program

Comprehensive Aftermarket Services Portfolio

- Parts and spare valves
- Repair
- Field services
- Preventative maintenance
- Equipment testing and diagnostics
- Remanufacturing
- Asset preservation
- Customer property management
- Training and recertification services
- Warranty

Customized Total Valve Care™ (TVC) Programs

Customized asset management plans that optimize uptime, availability, and dedicated services.

- Engineering consultancy
- Site management
- Flange management
- Startup and commissioning
- Spare parts and asset management
- Operational support
